

WATERPROOFING

NEW PRODUCTS AND TECHNOLOGIES ARE BEING LAUNCHED CONSTANTLY. AS PART OF THIS SPECIAL FEATURE, *BUILDING CONNECTION* HAS DONE THE HARD WORK FOR YOU AND PUT TOGETHER 50 PRODUCTS THAT CAN ASSIST IN A METAL ROOFING INSTALLATION.

1. MULTIPLE SEALS

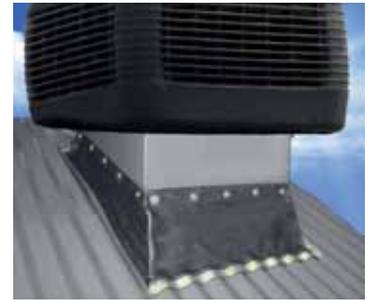

Penetrations in roofs can be an occupant's nightmare if they are not sealed and waterproofed correctly. With so many HVAC, water and solar systems appearing on today's roofs, there are more service lines wanting to find a way into the roof cavity. This neat solution from Aquarius Distribution, MultiSeal, provides a waterproof entry for electrical or data cables.

2. VERY FLASH AND PRACTICAL

Sureform Super is a composite product incorporating a highly malleable perforated aluminium core, sandwiched between a durable heavy gauge polymer top surface and a full width butyl adhesive backing. As a non-toxic product, it eliminates environmental concerns with respect to water harvesting and run-off. It's available in 140mm or 280mm square patches.

3. COOL SOLUTION

Evaporative coolers take up sizeable penetrations and can be quite difficult to properly flash using roll materials. Now there is the Evap Flashing that is specifically designed to make the job easier and sealed with integrity. The Evap gives metal droppers a water tight seal when penetrating corrugated metal.

4. SEE AROUND CORNERS

Applying silicone to fill nooks and crannies that are virtually out of sight becomes a bit of hit and miss – and that's not good enough if you are aiming for a proper watertight finish. This is where the Bent-Over nozzle, which is easily attached to your silicone tube, can be invaluable. All you have to do is join up enough of these ball joint nozzles and then you can squeeze your way in!

5. STRETCH YOUR IMAGINATION

Smartform Flexible Flashing Tape is a durable sealing solution that has 100% self-adhesive backing and can be used for wall connections, dormer seals and chimney abutments. The crepe metal surface has a similar lifetime as lead and zinc flashing, but with improved 'shapeability' (stretchability of approximately 60%). It's self-adhesive and can be applied to dust-free surfaces.

6. PERFORMING SEALS

There's nothing to be gained by using cheap silicone in out-of-sight places like gutters and hidden valleys. Their poor performance will eventually show up and by that time, the leaks could have caused some expensive damage to your customer's premises.

Bostik's Seal in the Wet silicone is made from an enhanced hybrid polymer formulation that gives an instant seal when applied to damp surfaces, during rain or even under water.
